2-WIRE LEVEL TRANSMITTER

5343

- *Potentiometer or Ohmic input*
- *Programmable sensor error value*
- *High measurement accuracy*
- *Unique process calibration function*
- *Programmable via standard PC*

Application

- Conversion of resistance variation to standard analog current signals, e.g. from Ohmic level sensors or valve positions.
- User-defined linearisation function can be activated.

Technical characteristics

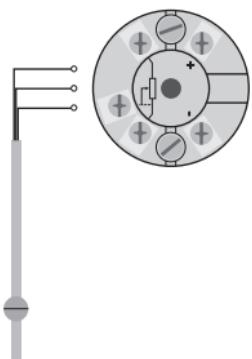

- Within a few seconds the user can program PR5343 to measure within the defined Ohmic values.
- Continuous check of vital stored data for safety reasons.
- The transmitter is protected against polarity reversal.
- PR5343 is configured to the current task by way of a PC, the PRelevel software and the communications interface Loop Link.
- The PRelevel configuration tool included in the PReset software has been developed specifically for the configuration of level applications. Among other things, it contains a function for "on line" measurement of input span as well as a linearisation function for volume linear output from horizontal cylindrical tanks.

Mounting / installation

- For DIN form B sensor head mounting. In non-hazardous areas the 5343 can be mounted on a DIN rail with a special fitting.

APPLICATIONS

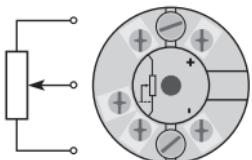

Ohmic level sensor
to 4...20 mA

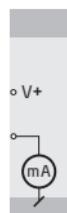

2-wire installation
in control room

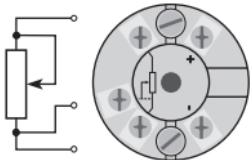

Potentiometer
to 4...20 mA

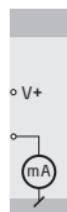

2-wire installation
in control room

Resistance to 4...20 mA

BLOCK DIAGRAM

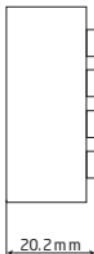

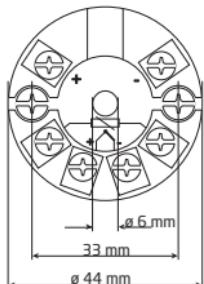

PROGRAMMING

- Loop Link is a communications interface that is needed for programming 5343.
- For programming please refer to the drawing below and the help function in the PRelevel software.
- Loop Link is not approved for communication with modules installed in hazardous (Ex) areas.

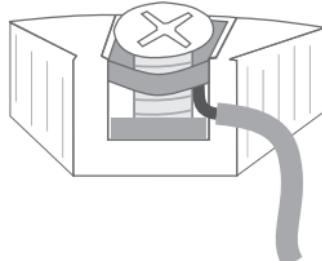

Order: Loop Link

Mechanical specifications

Mounting of sensor wires

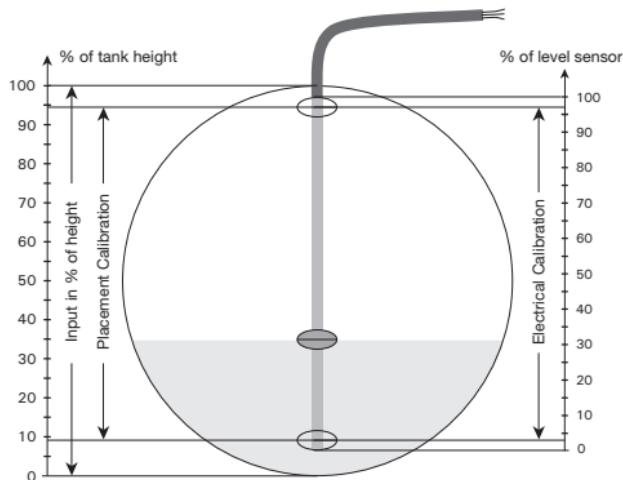

Wires must be mounted between the metal plates.

CONFIGURATION OF POTENTIOMETER INPUT

In an Ohmic level sensor the resistance value changes when a magnetic floater activates the reed contacts in the sensor. This means that it is usually not possible to make use of the entire level sensor as input span. When PR5343 is used with a potentiometer input, the PRelevel software contains the following special functions for configuration:

[Calibration Password] is 4711. This password should be entered at program start. The only parameters which can be changed without entering this password are Input Low and High for the potentiometer input. The menu item is located under **Tools > Options**. Please pay special attention to the text in the '**Information**' window during transmission. When the configuration cannot be sent to the transmitter due to lack of password, the following text will appear: 'Operation aborted.' 'Configuration NOT transmitted to the device.'

Figure 1, cross section of horizontal cylindrical tank

The following description of configuration with potentiometer input is based on figure 1. Please note that the PRelevel software only comes in an English-language version. Therefore the menu texts are represented here as they are seen on the screen. First choose the **[Input]** tab:

[Electrical Calibration] Enter the range to be detected by the connected potentiometer or let PRelevel measure the available range. The transmitter must be connected to the communications interface before the values can be measured. The values in figure 1 are Low = 3% og High = 97%.

[Placement Calibration] Enter the placement of the 'Electrical Calibration' Low and High points of the level sensor in relation to the height of the tank. These values are used for calculation of linearisation values and for calculation of 0 and 100% height.

The values in figure 1 are Low = 9% and High = 94%.

[Input] Enter the desired input span in relation to the height. When input Low and High are selected as 0 and 100%, the input can never go below 9% and above 94% due to the design and mounting of the level sensor. If the output span is 4...20 mA, the output will only vary between 5.44...19.04 mA.

The values in figure 1 are Low = 0% and High = 100%.

ACTIVATION OF EMBEDDED LINEARISATIONS

The PRelevel software contains embedded linearisation functions for horizontal cylindrical tanks and spherical tanks. The linearisation functions can be activated as follows:

Custom input type: In order to gain access to a customer-defined linearisation, the selection in the **[General Type]** input box must end with the text 'Custom' and the **[Calibration Password]** 4711 must be entered.

Activation of linearisation: Choose the **[Options]** tab in the PRelevel 5343 window. If one of the embedded linearisations is to be used, the selection in the 'Linearisation' window must be 'Polynomial....(Relative)' in order to retrieve the most accurate linearisation files. The files are retrieved by way of the following menus: >**Specify** + select >**File** > **Open** in the main menu + select >**File name** >**Open** in the file dialogue box.

User-defined linearisation: It is possible to enter specific linearisation tables in the >**Specify** menu.

Installation notes.

In a potentially explosive gas atmosphere, the transmitter shall be mounted in an enclosure in order to provide a degree of protection of at least IP20 according to EN60529.

If the transmitter is installed in an explosive atmosphere requiring the use of equipment of category 1 G, 1 M or 2 M, and if the enclosure is made of aluminum, it must be installed such, that ignition sources due to impact and friction sparks are excluded.

If the enclosure is made of non-metallic materials, electrostatic charging shall be avoided.

For installation in a potentially explosive dust atmosphere, the following instructions apply:

The transmitter shall be mounted in a metal enclosure form B according to DIN43729 that is providing a degree of protection of at least IP6X according to EN60529, that is suitable for the application and correctly installed.

Cable entries and blanking elements shall be used that are suitable for the application and correctly installed.

For an ambient temperature $\geq 60^{\circ}\text{C}$, heat resistant cables shall be used with a rating of at least 20 K above the ambient temperature.

The surface temperature of the enclosure is equal to the ambient temperature plus 20 K, for a dust layer with a thickness up to 5 mm.

IECEx Installation drawing

For safe installation of 5343A the following must be observed. The module shall only be installed by qualified personnel who are familiar with the national and international laws, directives and standards that apply to this area.

Installation note:

For installation in a potentially explosive gas atmosphere, the following instructions apply:

For nA installation the transmitter must be installed in a metal enclosure e.g. a form B enclosure, providing a degree of protection of at least IP54 according to IEC60529 that is suitable for the application and correctly installed or in an enclosure with type of protection Ex n or Ex e.

For intrinsically safe installation the transmitter must be installed in enclosure providing a degree of protection of at least IP20 according to IEC60529 and that is suitable for the application.

Cable entry devices and blanking elements shall fulfill the same requirements

For an ambient temperature $\geq 60^{\circ}\text{C}$, heat resistant cables shall be used with a rating of at least 20 K above the ambient temperature.

For installation in a potentially explosive dust atmosphere, the following instructions apply:

The surface temperature of the enclosure is equal to the ambient temperature plus 20 K, for a dust layer with a thickness up to 5 mm.

The transmitter must be mounted in an enclosure according to DIN 43729 that provides a degree of protection of at least IP6X according to IEC60529, and that is suitable for the application. Cable entry devices and blanking elements shall fulfill the same requirements.

IECEx Installation drawing

For safe installation of 5343B the following must be observed. The module shall only be installed by qualified personnel who are familiar with the national and international laws, directives and standards that apply to this area.

Installation notes.

In a potentially explosive gas atmosphere, the transmitter shall be mounted in a metal form B enclosure in order to provide a degree of protection of at least IP20 according to IEC60529. If however the environment requires a higher degree of protection, this shall be taken into account.

If the transmitter is installed in an explosive atmosphere requiring the use of equipment protection level Ga, Ma and Mb, and if the enclosure is made of aluminum, it must be installed such, that ignition sources due to impact and friction sparks are excluded.

For installation in a potentially explosive dust atmosphere, the following instructions apply:

For explosive dust atmospheres, the surface temperature of the outer enclosure is 20 K above the ambient temperature.

The transmitter shall be mounted in a metal enclosure form B according to DIN43729 that is providing a degree of protection of at least IP6X according to IEC60529, that is suitable for the application and correctly installed.

Cable entries and blanking elements shall be used that are suitable for the application and correctly installed.

For an ambient temperature $\geq 60^{\circ}\text{C}$, heat resistant cables shall be used with a rating of at least 20 K above the ambient temperature.

The entity concept

The Transmitter must be installed according to National Electrical Code (ANSI-NFPA 70) and shall be installed with the enclosure, mounting, and spacing segregation requirement of the ultimate application.

Equipment that is FM-approved for intrinsic safety may be connected to barriers based on the ENTITY CONCEPT. This concept permits interconnection of approved transmitters, meters and other devices in combinations which have not been specifically examined by FM, provided that the agency's criteria are met. The combination is then intrinsically safe, if the entity concept is acceptable to the authority having jurisdiction over the installation.

The entity concept criteria are as follows:

The intrinsically safe devices, other than barriers, must not be a source of power. The maximum voltage $Ui(V_{MAX})$ and current $Il(I_{MAX})$, and maximum power $Pi(P_{MAX})$, which the device can receive and remain intrinsically safe, must be equal to or greater than the voltage (Uo or V_{OC} or V_i) and current (Io or I_{SC} or I_i) and the power Po which can be delivered by the barrier.

The sum of the maximum unprotected capacitance (C_i) for each intrinsically safe device and the interconnecting wiring must be less than the capacitance (C_s) which can be safely connected to the barrier.

The sum of the maximum unprotected inductance (L_i) for each intrinsically safe device and the interconnecting wiring must be less than the inductance (L_s) which can be safely connected to the barrier.

The entity parameters Uo, V_{OC} or V_i and Io, I_{SC} or I_i , and C_s and L_s for barriers are provided by the barrier manufacturer.

Notas para instalação

Para a instalação em uma atmosfera de gás potencialmente explosivo, se aplicam as instruções a seguir:

Para a instalação nA o transmissor deve ser instalado em um invólucro de metal, por exemplo, gabinete em forma B que forneça um grau de proteção de pelo menos IP54 de acordo com IEC60529 ou em um invólucro com tipo de proteção Ex n ou Ex e.

Para a instalação Ex ic o transmissor deve ser instalado em um invólucro proporcionando um grau de proteção de IP20, pelo menos, de acordo com a norma ABNT NBR IEC 60529. E o invólucro deve ser adequado para a aplicação e corretamente instalado.

Dispositivos de entrada de cabos e elementos de supressão devem cumprir os mesmos requisitos.

Para temperatura ambiente $\geq 60^{\circ}\text{C}$, fios de resistência ao calor devem ser usados com uma faixa de pelo menos 20K acima da temperatura ambiente.

Para a instalação em uma atmosfera de poeira potencialmente explosiva , se aplicam as instruções a seguir:

O transmissor deve ser montado em invólucro de metal forma B de acordo com DIN43729 que está fornecendo um grau de proteção de pelo menos IP6X de acordo com ABNT NBR IEC60529.

O invólucro deve ser adequado para aplicação e instalado corretamente.

As entradas dos cabos e os elementos de obturação que podem ser utilizados são adequados para a aplicação e corretamente instalados.

A temperatura da superfície do invólucro é igual à temperatura ambiente mais 20 K, para uma camada de pó , com uma espessura até 5 mm.

Desenho de Instalação InNMETRO

Para instalação segura do 5333D ou 5343B o seguinte deve ser observado. O modo deve apenas ser instalado por pessoas qualificadas que são familiarizadas com as leis nacionais e internacionais, diretrizes e padrões que se aplicam a esta área.

Notas de Instalação.

Em uma atmosfera de gás potencialmente explosiva, o transmissor deve ser montado em um enclosure a fim de garantir um grau de proteção de no mínimo IP20 de acordo com ABNT NBR IEC60529. Se contudo o ambiente requer um nível de proteção maior, isso deve ser levado em conta

Se o transmissor é instalado em uma atmosfera explosiva exigindo o uso de equipamento de proteção de nível Ga e se o invólucro é feito de alumínio, ele deve ser instalado de modo que, mesmo em caso de avaria rara, fontes de ignição devido a impacto e fricção, falscas são eliminadas; Se o enclosure é feito de materiais não metálicos, cargas eletrostáticas devem ser evitadas.

Se o enclosure é feito de materiais não metálicos, cargas eletrostáticas devem ser evitadas.

Para instalação em atmosfera de poeira potencialmente explosiva, as instruções a seguir:

O transmissor deve ser montado em invólucro de metal forma B de acordo com DIN43729 que está fornecendo um grau de proteção de pelo menos IP6X de acordo com ABNT NBR IEC60529. O invólucro deve ser adequado para aplicação e instalado corretamente.

As entradas dos cabos e os elementos de obturação que podem ser utilizados são adequados para a aplicação e corretamente instalados.

Para temperatura ambiente $\geq 60^\circ\text{C}$, fios de resistência ao calor devem ser usados com uma faixa de pelo menos 20K acima da temperatura ambiente.

A temperatura da superfície do invólucro é igual à temperatura ambiente mais de 20 K, por uma camada de pó, com uma espessura até 5 mm.

Displays

Programmable displays with a wide selection of inputs and outputs for display of temperature, volume and weight, etc. Feature linearization, scaling, and difference measurement functions for programming via PReset software.

Ex interfaces

Interfaces for analog and digital signals as well as HART signals between sensors / I/P converters / frequency signals and control systems in Ex zone 0, 1 & 2 and for some devices in zone 20, 21 & 22.

Isolation

Galvanic isolators for analog and digital signals as well as HART signals. A wide product range with both loop-powered and universal isolators featuring linearization, inversion, and scaling of output signals.

Temperature

A wide selection of transmitters for DIN form B mounting and DIN rail devices with analog and digital bus communication ranging from application-specific to universal transmitters.

Universal

PC or front programmable devices with universal options for input, output and supply. This range offers a number of advanced features such as process calibration, linearization and auto-diagnosis.
